- Emergency Action Plan
WHAT IS A FOOD ALLERGY?

A food allergy is an immune response that happens shortly after a person eats a food.

Food allergy develops after eating a food more than one time.

The majority of allergic reactions to foods are mild, however some can be fatal and require emergency treatment.
The difference between a food allergy and intolerance

<table>
<thead>
<tr>

<th>Food Intolerance</th>
<th>Food Allergy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Where reaction takes place</td>
<td>Digestive system</td>
<td>Immune System</td>
</tr>
<tr>
<td>Intensity of reaction</td>
<td>Mild to moderate discomfort</td>
<td>Can be life-threatening</td>
</tr>
<tr>
<td>Symptoms</td>
<td>Gastrointestinal</td>
<td>Multiple body systems; skin, respiratory, heart, and gastrointestinal</td>
</tr>
<tr>
<td>Reaction time</td>
<td>May be delayed</td>
<td>Usually immediate (within 30-60 minutes)</td>
</tr>
<tr>
<td>Action to take</td>
<td>See healthcare provider</td>
<td>Call 911</td>
</tr>
</tbody>
</table>
The severity of allergic reactions to foods can vary

• For some patients, they may only have worsening eczema or atopic dermatitis or itching.
• For other patients, it can cause a very severe, life-threatening reaction.
• Also in a patient, it may be that one food causes mild symptoms, but other foods may cause anaphylaxis.
• The severity of reactions can vary in a patient from one day to the next.
Common Food Allergens

Top 9 Food Allergens
(Account for 90% of all food allergy reactions in the United States)

- Peanuts
- Tree Nuts: Almonds, Brazil nuts, cashews, hazelnuts, macadamia nuts, pecans, pine nuts, pistachios, Brazil nuts, or mixed nuts, walnuts
- Wheat
- Dairy: Cheese, cow's milk, ice cream, cottage cheese, ice cream, pudding, yogurt
- Fish: Anchovies, sardines, cod, salmon, tuna
- Shellfish: Crab, lobster, shrimp
- Eggs
- Soy: Edamame, soy milk, soy sauce, tofu
- Sesame: Salad dressings, breads, baked goods, cereals, crackers, spreads, mayonnaise, mustard, sunflower, safflower, canola, groundnut, sunflower, chips and crackers

* Food allergens may appear in more food items than those listed. Check ingredients and read food labels to confirm. When in doubt, call the manufacturer to determine if a food is allergy safe.

More than 170 foods have been reported to cause allergic reactions, including:
- Apples, Avocados, Celery, Citrus, Corn, Garlic, Gelatin, Meat, Mustard, Poppy seeds, Spices, Sunflower seeds

AllergyAsthmaNetwork.org
Epidemiology

Approximately 20 million persons in the United States have food allergy.

16 million adults and 4 million children, data from 2021 (CDC)

1 in every 13 children in the United States have a food allergy
Anaphylaxis is a life-threatening allergic reaction that affects more than one organ system. Common symptoms include:

- **MOUTH**: Itching, swelling of lips or tongue
- **THROAT**: Hoarseness, tightness, trouble swallowing
- **HEART**: Fast, weak pulse, dizziness, passing out, cardiac arrest
- **CHEST**: Shortness of breath, cough, wheezing, chest pain, tightness
- **SKIN**: Itching, hives, redness, swelling
- **STOMACH**: Vomiting, diarrhea, cramps
- **OTHER**: Feeling of impending doom, hives, itching, red eyes, nasal congestion

**Signs and Symptoms**

- **FOOD**
  - Peanuts
  - Tree nuts: almonds, pecans, cashews, walnuts
  - Shellfish
  - Cow’s milk products
  - Hen’s eggs
  - Fish
  - Soy
  - Wheat

- **VENOM**
  - Yellow jackets
  - Wasps and hornets
  - Honeybees
  - Fire ants
  - Spiders

- **LATEX**
  - Balloons
  - Rubber gloves
  - Catheters
  - Bandages/latex barrier bandages
  - Dental dams

- **MEDICATION**
  - Penicillin
  - Aspirin, ibuprofen, and other NSAID pain relievers

**Prevention**

- **Epi Everywhere! Every Day! Right Away!**
  - **RECOGNIZE THE SEVERITY**
    - Anaphylaxis is life-threatening, unpredictable, presents in multiple ways, and can progress quickly. If symptoms appear, refer to your Emergency Care Action Plan.
  - **USE EPINEPHRINE IMMEDIATELY**
    - Epinephrine is the first line of treatment to stop the progression of anaphylaxis. Use your epinephrine auto-injector at the first sign of symptoms – don’t wait to see what happens!
  - **CALL 911**
    - Always call for emergency medical assistance and go to the emergency room for follow-up observation and treatment.
  - **CARRY TWO AUTO-INJECTORS**
    - Keep two epinephrine auto-injectors on hand, in case symptoms recur before emergency medical assistance is available. Up to 35% of people will require more than one dose.
  - **FOLLOW UP**
    - Consult a board-certified allergist for accurate diagnosis and prevention/treatment plan.
## Signs and Symptoms of Food Allergy in Infants and Toddlers

</table>
The diagnosis of food allergy

• The history
• When did the reaction happen?
• The symptoms
• Quantity and how the food was prepared
• Reproducibility
• Treatment, resolution/outcomes
• Skin tests
• Specific IgE blood tests
• Oral challenge in some patients to confirm the diagnosis
Are food allergies hereditary?

- For some patients, food allergy may affect more than one member of the family.

- If one of the patients has allergy, there is increased risk of allergy in the child. If both parents have allergy, the risk increases further.
How to Manage Food Allergy

Avoidance of the food allergen

Consider referral to dietician for children with poor growth, eating disorders and infants with multiple food allergies

Education

Risk assessment (asthma, delayed epinephrine use, prior life-threatening reaction, adolescent/young adult)

Written emergency action plan

Emergency preparedness, including prescription and access to self-injectable epinephrine

© AAAAI Revised 2021
How can we live with food allergy?

• Hispanics love to get together with family and friends to eat and celebrate.
• Our parties consist of food and sharing with family.
• It is important for everyone to understand if a family member has a food allergy
• We must offer alternative foods that are safe for the patient, so they feel included.
Treatment
**Avoidance**

<table>
<thead>
<tr>
<th>Complete avoidance</th>
<th>Exceptions: Oral Allergy Syndrome (OK to eat trigger fruits/vegetables if desired) and patients who tolerate baked products containing egg or milk</th>
</tr>
</thead>
<tbody>
<tr>
<td>FALCPA ¹ Food Allergen Labeling and Consumer Protection Act (FALCPA) requires the 9 major food allergens to be clearly labeled on food products manufactured in the US</td>
<td>Sesame added in 2021</td>
</tr>
<tr>
<td>Different advisory warning labels do not denote different risk levels</td>
<td>Examples: may contain; processed in a facility with; made on shared equipment</td>
</tr>
<tr>
<td>Cross contamination: Caution with buffets, ice cream parlors, shared equipment</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Treatment: Epinephrine</th>
</tr>
</thead>
<tbody>
<tr>
<td>The gold standard treatment and the only one that saves lives.</td>
</tr>
<tr>
<td>Carry at all times. Keep two doses available!</td>
</tr>
<tr>
<td>Protect from extreme temperatures.</td>
</tr>
<tr>
<td>No other medication will save lives in a potentially life-threatening and severe reaction. Do not rely on antihistamines or steroids.</td>
</tr>
</tbody>
</table>
Food allergy exposures can happen anytime, anywhere. Always carry epinephrine with you for emergency treatment.

Treating anaphylaxis in the first few minutes can save a life.

**GIVE EPINEPHRINE FIRST, GIVE EPINEPHRINE FAST**

After using epinephrine, call 911 and go to an emergency room for immediate observation and care.
Epinephrine saves lives!

• It is applied to the side of the thigh- the length of time depends on the brand of the autoinjector.

• Have two epinephrine autoinjectors available at all times.
Treatment

• There is no cure for food allergies!
• Oral immunotherapy to eat amounts of the allergen increasing over time under the care of an allergist
• Omalizumab for patients with food allergies from 12 months of age.
• For patients with eosinophilic esophagitis and food allergy: dupilumab or oral budesonide
• It is possible that interesting alternative ways to administer epinephrine will become available in the near future.
Living with Food Allergy
Social and Emotional

Decreased quality of life and increased stress and anxiety are common

25% may experience food allergy-related bullying

Food allergy support group may be beneficial

Referral to a mental health professional may be necessary

Copyright © 2024 United, Let's talk about...
Use Caution When Reading Food Labels

• Look for the “Contains” statement
• Do not purchase if your allergen is listed on the “Contains” statement
• If there is no “Contains” statement, read the entire list.
• Talk to your allergist to find out if you need to avoid foods with warning statements.
• Warning statements may vary from product to product. Examples may include: “May contain,” “Produced in a facility that,” or “Manufactured on equipment shared with”
• Read food labels every time you buy
• Food manufacturers may change ingredients frequently. If in doubt, do not eat the food.
# Hide & Seek Food Allergens

Ingredients derived from common food allergens can be listed under many different names on the food label.

Practical Information for Eating Outside of Your Home

• If you are eating at a friend or family member’s home, notify them of the food allergy as early as possible.

• In a restaurant, notify the server, chef or manager.

• Do not be shy. If you feel that the staff is not taking the food allergy seriously, do not take the risk of eating there.

• It is never too early for a child or adolescent to notify others about their allergy. It is teaching them to advocate for themselves.
FOOD ALLERGY ALERT

Attention: Chef

I am allergic to:

__________________________________________________________

__________________________________________________________

This is an allergy, not a preference! If I eat even a tiny amount of a food allergen, it can cause a life-threatening allergic reaction.

• Please make sure my meal, including cooking oils, sauces, seasonings and ingredients, does not contain any of my allergens.

• Please make sure cooking utensils, equipment and surfaces are fully cleaned prior to cooking my meal.

Thank you!

For more information, visit AllergyAsthmaNetwork.org/Food-Allergies.

Chef Card: List of Food Allergens
Cross contamination

Wash your hands with soap and water before meal prep. Disinfectants do not help.

Wash surfaces, utensils and equipment. Use hot water and soap after meal preparation.

Consider use of plates, pans and sponges exclusively that allergens do not touch.

Protect safe foods. Store allergen free foods in a separate cabinet or refrigerator. Mark safe foods with stickers.

Follow the rule not to share foods, utensils or drinks.

Avoid buffets or dining halls- risk of cross contamination may be increased due to shared utensils and spilled food.
The Reality of Living with Food Allergy

- There is a lack of information in general for patients with food allergies.
- For Spanish-speaking patients, there is a lack of materials in their language and at their level of understanding.
- Education is very important to understand the condition and keep the patient safe.
- Education empowers patients and their families.
Food Insecurity: Hispanics

- Study of a low-income Puerto Rican population Hartford, CT
- Latino families were 22.8% more likely than non-Latino whites to report food insecurity
- Attending cultural events/church- indicator of stronger social networks and food security
- Spanish-speaking only households- risk factor for food insecurity
- Referral to social work likely to be helpful.
Food Insecurity and Mental Health in Hispanics

- Survey of low-income pregnant Latina (majority Puerto Rico) women in Hartford, CT
- More than 66% participated in WIC (Supplemental Nutrition Program for Women, Infants and Children)
- 1/3 uninsured, ½ bilingual and 1/3 food insecurity prior to survey
- Elevated symptoms of depression when household experienced food insecurity
- Medical team can ensure information regarding WIC and other support is available—offer materials in native/ preferred language

Food Deserts: Interactive Tool Using Low Income and Low Access by Mileage
Organizations Exist to Help with Education and Provide Resources

• **Securing Safe Food** is a nonprofit organization that provides food for people with allergies to food pantries across the United States.

• **AllergyStrong** offers education and advocacy to better help low-income food allergy patients and their caregivers.

• **FOODiversity** connects patients and families with food allergies with food resources.

https://allergyasthmanetwork.org/food-allergies/
IMPORTANT TAKE HOME MESSAGES

- Avoid foods that contain your food allergens
- Read food labels before eating
- Be prepared in case of an allergic reaction - carry epinephrine!

What is a Clinical Trial?

Clinical trials are research studies in which people volunteer to help find answers to specific health questions. Clinical trials provide an opportunity to explore alternative treatments beyond the standard options and can also be considered a treatment option. They aim to improve existing treatments or discover new treatments.

Potential Benefits to Participating in a Clinical Trial
1. Access to new treatments
2. Contribution to medical knowledge
3. Close monitoring and care
4. Potential cost savings
5. Empowerment and advocacy

Remember that participating in a clinical trial also involves risk, such as potential side effects or uncertainty about if the treatment will work. It is essential to discuss these factors with your healthcare provider and carefully weigh the pros and cons before deciding to participate.
Why is Diversity Important in Clinical Trials?

• People may experience the same disease differently.
• Including a variety of lived experience, living conditions, and characteristics (such as race, ethnicity, age, sex, and sexual orientation) ensures that all communities can benefit from scientific advancements.
• Diverse clinical trial participants help researchers understand safety and how the drug works for different populations.
• It also helps researchers better understand patterns of difference in health and illness based on different backgrounds.

The Hispanic Latino community makes up 18% of the US population. But less than 8% of clinical trial participants identify as Hispanic.
